

Simple Memory System Example

■ Addressing

- 14-bit virtual addresses
- 12-bit physical address
- Page size = 64 bytes

Simple Memory System TLB

- **16 entries**
- **4-way associative**

VPN = 0b1101 = 0x0D

Translation Lookaside Buffer (TLB)

Set	Tag	PPN	Valid	Tag	PPN	Valid	Tag	PPN	Valid	Tag	PPN	Valid

Intel Core i7 Memory System

Processor package

End-to-end Core i7 Address Translation

Core i7 Level 1-3 Page Table Entries

63	62	52	51	12	11	9	8	7	6	5	4	3	2	1	0
XD	Unused	Page table physical base address				Unused	G	PS		A	CD	WT	U/S	R/W	P=1
Available for OS (page table location on disk)															P=0

Each entry references a 4K child page table. Significant fields:

P: Child page table present in physical memory (1) or not (0).

R/W: Read-only or read-write access access permission for all reachable pages.

U/S: user or supervisor (kernel) mode access permission for all reachable pages.

WT: Write-through or write-back cache policy for the child page table.

A: Reference bit (set by MMU on reads and writes, cleared by software).

PS: Page size either 4 KB or 4 MB (defined for Level 1 PTEs only).

Page table physical base address: 40 most significant bits of physical page table address (forces page tables to be 4KB aligned)

XD: Disable or enable instruction fetches from all pages reachable from this PTE.

Core i7 Level 4 Page Table Entries

63	62	52	51	12	11	9	8	7	6	5	4	3	2	1	0
XD	Unused	Page physical base address				Unused	G		D	A	CD	WT	U/S	R/W	P=1
Available for OS (page location on disk)															P=0

Each entry references a 4K child page. Significant fields:

P: Child page is present in memory (1) or not (0)

R/W: Read-only or read-write access permission for child page

U/S: User or supervisor mode access

WT: Write-through or write-back cache policy for this page

A: Reference bit (set by MMU on reads and writes, cleared by software)

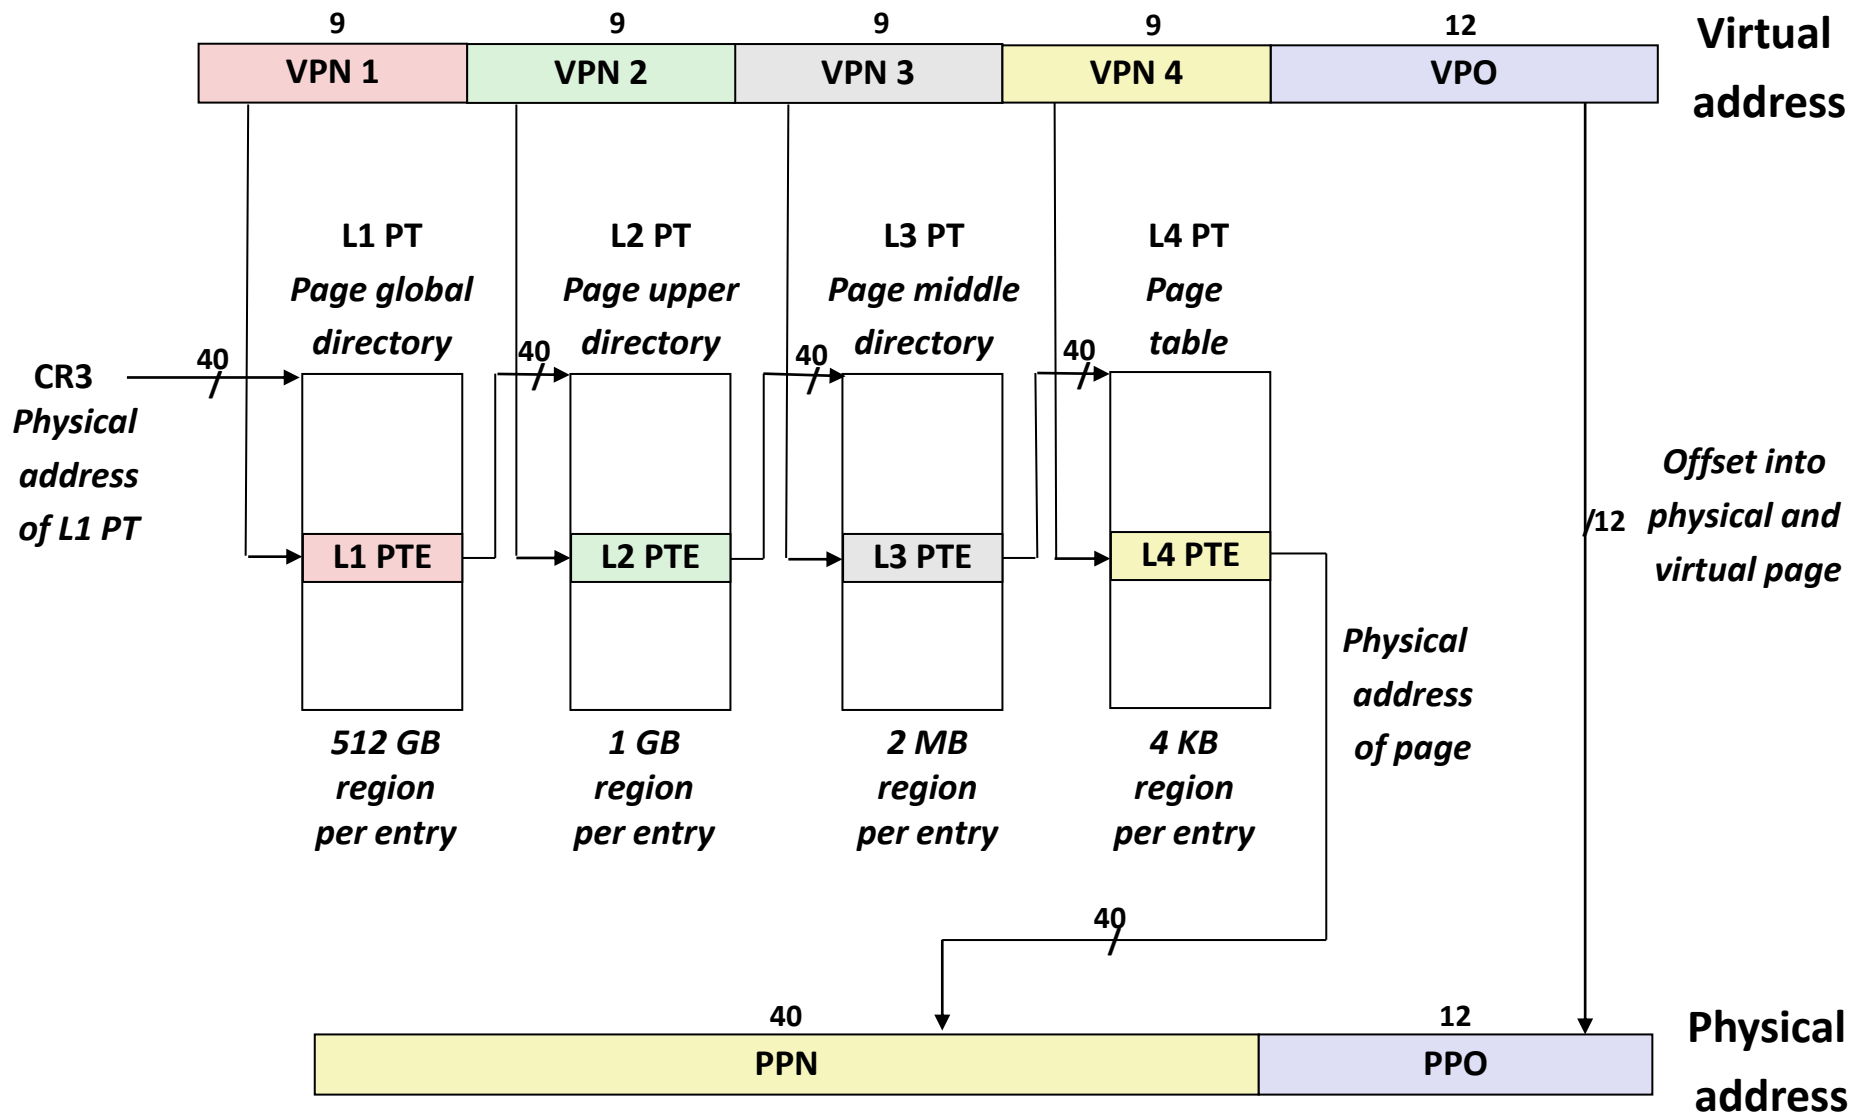

D: Dirty bit (set by MMU on writes, cleared by software)

G: Global page (don't evict from TLB on task switch)

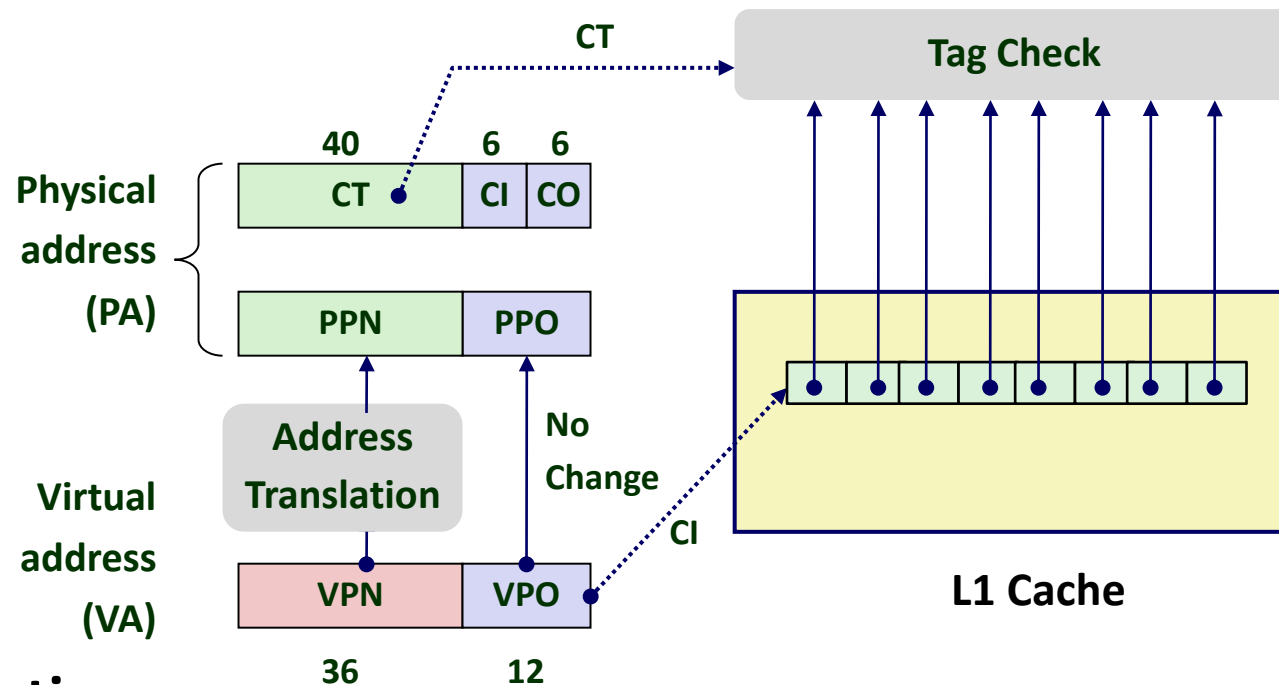

Page physical base address: 40 most significant bits of physical page address
(forces pages to be 4KB aligned)

XD: Disable or enable instruction fetches from this page.

Core i7 Page Table Translation

Cute Trick for Speeding Up L1 Access

■ Observation

- Bits that determine CI identical in virtual and physical address
- Can index into cache while address translation taking place
- Generally we hit in TLB, so PPN bits (CT bits) available quickly
- ***"Virtually indexed, physically tagged"***
- Cache carefully sized to make this possible

Virtual Address Space of a Linux Process
